Description			
<p>The UML validation ruleset should be extensible and manageable. The developer should be able to:* create a new rule (possibly inside a named ruleset)* modify an existing custom rule* activate/deactivate rules for validation</p> <p>Rationale: For UML extensions (my usecase is the OntoUML Language), a custom set of validation rules needs to be defined which should be integrated into the Modelio processes. This allows creating custom model validation scenarios. Furthermore, it makes the contract between a model and the language behind Modelio explicit.</p>
