Target version:			

Description

there are multiple issues with regards to macOS integration in your latest release 4.0.1

- the CFBundleShortVersionString entry in your Info.plist file is set to "4.0.0"; it should be set to "4.0.1" to be correct. you can see this incorrect version number in ColumnView in the Finder
- the CFBundleVersion entry in your Info.plist file is set to "4.0.0.last"; it should be set to "4.0.1"; to be correct. you can see this incorrect version number in QuickLook in the Finder
- the CFBundleGetInfoString entry is included in your Info.plist. this has been deprecated for more than 10 years and should never be included. it will prevent any version number from showing up in the GetInfo view in the Finder. also it is set to an inappropriate value anyway

last but not least, the file-system name is "Modelio 4.0";. apps on macOS should never have any version number as part of their name.
